

CROC® ForkCoating

A Croc that won't take a
“Bite” out of your budget!

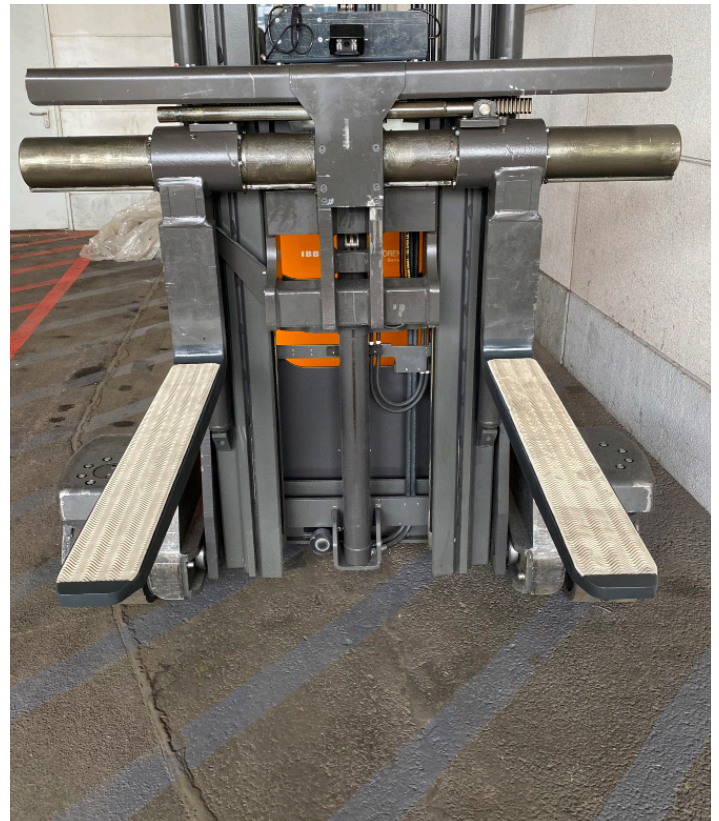

The CROC-Team in action in the automotive industry

The problem: Lack of grip when transporting sensitive steering systems

The slippery surface of the forks does not ensure a safe transport of the steering system components. When the forklift brakes, the load can easily slip off the forks. Therefore, the truck is only driven at reduced speed, which inhibits the workflow. Nevertheless, it is not always possible to prevent the load from slipping. This regularly results in high costs due to slower processes and rejects.

The CROC-Team helps: GripFix as a solution for more safety and protection of the goods during the loading process

Several forks were equipped with a 6 mm thick GripFix „white profiled” coating on the spot. The effect is immediately apparent in operation: The soft surface ensures gentle transport of the sensitive steering systems and also prevents slipping, even in wet conditions. Despite the softer surface of the CROC coating, it scores with high abrasion and cut resistance. For now it is clear that further forklifts shall be retrofitted with the GripFix coating.

CROC GripFix white: More safety and protection of goods when loading

Mission accomplished – off to the next challenge!
