ForkCoating

Best grip for sure!

## The CROC-Team in action at food industry

### The problem: Lack of grip when handling food products with a pallet truck

The plastic pallets used have virtually no grip on the forks when the lift truck brakes. The pallets loaded with valuable foodstuffs regularly slip off the forks, fall on the floor and are thus rendered unfit for sale.

### The CROC-Team helps: More hygiene and safety during the loading process

After a short test phase, four new electric pallet trucks were equipped with a 5mm thick, unprofiled CROC coating in blue. In use, the effect is immediately apparent: the load carriers no longer slip off the forks thanks to the high slip resistance; with an added bonus of a low-noise operation.

Special feature: The FDA-certified polyurethane is antibacterial thus complies with hygiene regulations in the food industry.

CROC „blue unprofiled“: Slip resistance in food sector

**Mission accomplished – off to the next challenge!**
